

Runbooks

ar008 · 6 July 2026

Runbooks are demolab’s **procedure layer**: named, repeatable jobs the agent runs step by step, showing each result and confirming before it moves on. Where a guide is always-on reference, a runbook is invoked when you want it. Type its name in capitals (**LINT**, **DOCTOR**, **GETTING-STARTED**) and the agent opens the runbook and drives it; type **HELP** for the full menu.

Each entry links to its source on GitHub, so this list stays in step with the engine.

- **GETTING-STARTED**: set up a fresh lab, interactively.
- **TOUR**: walk through the repository.
- **LINT**: audit the prose and figures against the house style.
- **DOCTOR**: audit the structure against the rules.
- **RED-TEAM**: attack the result’s validity.
- **STEELMAN**: make the strongest case for it.
- **NEXT**: suggest what to run next.
- **GROUND-CLAIMS**: back every claim with a run or a citation.
- **MIGRATE-CODE**: wrap an existing codebase.
- **MIGRATE-STACK**: switch language (MATLAB, R, Julia, Octave).
- **FROM-JUPYTER**: convert a notebook.
- **FROM-PAPER**: reproduce a paper.
- **EMBED-DOCS**: use demolab as a docs subfolder in another project.
- **UPDATE**: vendor the latest engine into your lab.

Their always-on counterpart, **guides**, are documented in a companion article in this collection.
