

First-year report

Draft table of contents

Eoin Murray CRSid: em586

Division F · PhD in Engineering

Academic years: 2025/26–2026/27 · Started January 2026

1 Introduction

- 1.1 Research context and motivation
- 1.2 Research problem and scope

2 Literature review

- 2.1 Spiking neural networks and temporal processing
- 2.2 Neural oscillations and their computational role
- 2.3 Theories of gamma oscillations

3 Research questions and objectives

- 3.1 Gamma oscillations as a substrate for reliable neuromorphic computing
- 3.2 Investigating the role of gamma oscillations in the brain

4 Methods

- 4.1 Models and theoretical framework
- 4.2 Experimental tasks, datasets and simulation procedures
- 4.3 Evaluation measures and comparisons

5 Progress and preliminary results

- 5.1 Comparison of simulated gamma oscillations with published findings
- 5.2 Training gamma networks using backpropagation through time (BPTT)
- 5.3 Excitatory firing-rate reduction in trained gamma networks
- 5.4 Streaming digit classification using trained gamma networks

6 Plan for the remaining PhD

- 6.1 Neuromodulation of gamma parameters
- 6.2 Incorporation of learning rules during inference
- 6.3 Gamma networks for spatial decision-making tasks
- 6.4 Gamma networks for decision-making and action selection
- 6.5 Implementation of gamma networks on neuromorphic hardware
- 6.6 Timeline and milestones

7 References

8 Appendices

- 8.1 Approved module coursework replacing the MRE
- 8.2 RDC logbook
